

ABSTRACT

A re-usable, portable, storage travel system for storing lotions, shampoos, creams, liquid medicines and the like for transport, particularly when traveling, in small-volume, flexible, sealable, plastic composite bags that will lay flat when not full and self-stand when partially filled and that will lay flat when not full and self-stand when partially filled. Further, the system provides adapters for transferring flowable materials from a larger container to a smaller container, particularly small-volume, flexible, sealable, plastic squeezable-tubes. Further, this invention also provides a re-usable, portable, storage travel system for storing a flowable food-grade substance such as, for example, liquor.
